## **AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Claims:

- 1. (Original) A method of crosslinking a polysaccharide comprising the steps of:
  - (a) providing a metal coordinating group having a reactive site,
- (b) derivatizing a polysaccharide with the metal coordinating group to produce a derivatized polysaccharide having bidentate ligands, and
- (c) crosslinking the derivatized polysaccharide having bidentate ligands with a metal ion to form a metal ligand coordination complex.
- 2. (Previously Presented) The method of claim 1 wherein the polysaccharide is selected from the group consisting of guar, xanthan, locust bean gum, hydroxy ethyl and hydroxy propyl derivatives of gums, hydroxyethylcellulose, and combinations thereof.
- 3. (Previously Presented) The method of claim 1 wherein the derivatized polysaccharide having bidentate ligands is crosslinked with a crosslinking agent comprising a compound chosen from the group consisting of copper, nickel, iron, ruthenium, palladium, platinum, iridium, cobalt, and combinations thereof.
- 4. (Previously Presented) The method of claim 1 wherein the bidentate ligands are selected from the group consisting of ethylenediamine, acetylacetonate ions, dithiocarbamate, 2,2'-bipyridine, 1,10-phenanthroline, 8-hydroxyquinolinato, and combinations thereof.
- 5. (Original) The method of claim 3 wherein the crosslinking agent is present in an amount up to about 500 moles of crosslinking agent per mole of polysaccharide.
- 6. (Original) The method of claim 3 wherein step (c) occurs within a wellbore in a subterranean formation.
- 7. (Original) The method of claim 3 wherein the polysaccharide comprises guar and the crosslinking agent is a derivative of iron or ruthenium.
  - 8. 31. (Cancelled)
  - 32. (Cancelled)
- 33. (Previously Presented) The method of claim 1 wherein the bidentate ligands comprise 2,2'-bipyridine.

- 34. (Previously Presented) A metal ion crosslinked polysaccharide produced by a method comprising the steps of:
- (a) providing a metal coordinating group having a reactive site on the metal coordinating group,
- (b) derivatizing a polysaccharide with the metal coordinating group to produce a derivatized polysaccharide having bidentate ligands that comprise 2,2'-bipyridine, and
- (c) crosslinking the derivatized polysaccharide having bidentate ligands to form a metal ion crosslinked polysaccharide.
